Apple Messages for Business Brand Nomination

Company: Walmart Inc.

Submitted By: Linq

Use Case

Many of Walmart's customers come for everyday essentials and shop weekly through pickup and delivery. A typical weekly order today means opening the Walmart app or walmart.com, searching for each item, rebuilding largely the same cart as last week, choosing a delivery slot and checking out. Sparky, Walmart's shopping assistant, already helps with discovery, reorders and order questions in the app and on the site. Walmart wants to bring Sparky to Apple Messages so that the same order becomes a short conversation. Their main goal is to save customers money and time so they can live better and Messages is where they can do that.

At a Glance

The Experience
A customer starts a conversation from Sparky in the Walmart app, a Messages button on walmart.com, a QR code in store, or a business invitation sent to a customer who opted in. They tell Sparky and it will suggest a menu, build the cart and book a delivery window. Customers can also reorder their usual items they buy in store and online already, get reminders when it's time for their next order, and build weekly or event meal plans.

Why It Fits
Walmart customers shop every week and most of that shopping is reordering staple items and using the same delivery time slots. This behavior is perfect for a short conversation in a message thread that the customer already has open and skips the need to spend time in the app or website. Quick Reply handles menu and meal-plan choices. List Picker lets customers pick products, substitutions and items from past orders. An iMessage app brings the Walmart app's product gallery and cart into the chat. Rich Links show products and the cart. Time Picker books pickup and delivery windows. Authentication signs the customer into their Walmart account before Sparky uses order history.

Value to Users
Less time spent and more money saved. A weekly order that takes several screens in the app becomes a few messages. Sparky can build a cart or meal plan to a budget the customer sets and suggests lower-priced alternatives. Reorder reminders mean fewer forgotten staples and fewer extra trips to the store.

Value to Society
Walmart's mission is helping people save money and live better. Bringing its assistant to Apple Messages for Business extends that help to customers and families planning on tight budgets and tight timelines.

Features

Apple Features	How Walmart Would Use It
Quick Reply	Menu, meal-plan and reorder choices.
List Picker	Product selection, substitutions and items from past orders.
Rich Links	Product pages and the customer's cart.
Time Picker	Pickup and delivery windows.
